Lesson 2: Fish Habitat

Activity: Observe, collect environmental data and describe an aquatic site near school using a field notebook.

Grade level: 4-8
Subjects: Science, social studies
Setting: Classroom, aquatic site near school
Duration: Three 50-minute classes
Key terms: Habitat, restoration

Objectives
Following this lesson, students will be able to:
• Name three basic requirements for fish survival.
• Name several Great Lakes fish species and their habitat.
• Explain two ways human activities impact Great Lakes fish habitat and affect the survival of fish and other organisms.
• Make purposeful observations of a nearby aquatic area using illustrations, photographs and narratives.
• Describe scientific questions about habitat and human impact based on observations.
• Use observations to predict which Great Lakes fish might favor that particular habitat.

Summary
A healthy environment supports a variety of native species. This is especially true for Great Lakes fish. Different species of fish require specific habitats, and loss or alteration of fish habitat can lead to population declines. This lesson explains some of the characteristics of healthy fish habitat and guides students in making their own field observations and scientific predictions.

Background
Like other living creatures, fish must meet certain basic needs for survival. Water, food and shelter are among the most important requirements:
• **Water:** Fish not only live in water, but they get oxygen from water. They breathe by taking water into their mouths and forcing it out through gill passages.
• **Food:** Fish must be able to find enough to eat at various life stages, whether they feed on microorganisms, small fish or larger prey.
• **Shelter:** Fish need a place to hide from predators and to reproduce. Some fish find shelter among submerged aquatic plants and shoreline vegetation, while others hide among rocks, soft sediments, or blend into clear, open waters.
Where can fish meet these needs? Fish are adapted to living in a variety of habitats. Some examples include the following:

- Rivers
- Streams
- Inland lakes
- Great Lakes
- Coastal wetlands

These habitats can vary greatly in water quality, turbidity, speed of water flow, amount of vegetation, water temperature, and water composition. Fish are particularly sensitive to water temperature and oxygen content, which play a major role in determining which species can survive in a given water body. See *Aquatic Habitat Data Worksheet* for examples of 14 common fish species and their preferred habitats.

**Human Impacts on Fish Habitat**

Over the last century, many factors have altered water quality and fish habitat and subsequently affected native fish populations. Some examples include:

- **Coastal Development:** Increasing development in coastal areas threatens the function and diversity of coastal wetlands. These areas are critical during the early life stages of many fish species. Removal of shoreline vegetation and trees from riverbanks can decrease shade and increase water temperature. Lack of vegetation also increases erosion and sedimentation, which alters spawning areas. Dams and other obstacles can prevent fish from migrating upstream to reach critical spawning habitat.

- **Invasive Species:** Invasive species compete with native fish for food and habitat. Round goby and Eurasian ruffe are examples of fish that have displaced native species in some locations. Invasive species can also change habitat. By filtering microorganisms, zebra mussels reduce food for native species and increase water clarity, which stimulates growth of aquatic plants.

- **Pollution:** Industrial pollutants, urban and agricultural runoff, and sewage overflows are some of the sources of pollutants that continue to impair Great Lakes water quality and impact fish habitat.

**Habitat Restoration**

People around the Great Lakes region are working to restore fish habitat for a number of native fish populations. Some examples include:

- **Lake Sturgeon:** Several groups teamed up to construct spawning reefs for lake sturgeon in the Detroit River to increase population of this threatened species.

- **Walleye:** The Fisheries Division of the Michigan Department of Natural Resources is implementing a walleye recovery plan for Saginaw Bay to enhance walleye populations and production in Saginaw Bay.

- **Coaster Brook Trout:** Researchers in the Upper Peninsula and Canada are tagging and monitoring this fish to learn more about its unique habitat requirements.

**Materials and Preparation**

- Aquatic Habitat Data Worksheet
- Water thermometer
- Secchi disk: for measuring water clarity (optional)
Procedure

1. Begin with a group discussion on fish habitat. Ask students: What do fish need in order to survive? (Basic needs include food, water and shelter.)

2. Ask students to name some different types of aquatic habitats where fish can meet their needs. Answers might include lakes, ponds, rivers, and small streams. How might these habitats vary? (Water might be warm, cold, fast moving, sluggish, turbid, clear, etc.) Explain that flowing water contains more oxygen than still water. Fish are very sensitive to the amount of dissolved oxygen available.

3. Using the Aquatic Habitat Data Worksheet download, discuss examples of common Great Lakes fish and their preferred habitats. Ask if students are familiar with these fish. Do they know of other examples?

4. Introduce the concept of indicator species. Explain that the presence of some organisms such as mayflies, stoneflies, and caddisflies indicates good water quality, an important part of healthy fish habitat. Note also that the number and type of aquatic plants (which form the base of the aquatic food web) can indicate health of a stream, river, pond or lake.

5. Next, ask if students are familiar with an aquatic habitat near their home or school. Ask them to describe its main characteristics.

6. Explain to students that they’ll be visiting a nearby aquatic area (river, pond, marsh, drainage ditch, etc.) to examine the habitat, record their observations (field data), and make predictions about what fish might live there.

7. Create groups of three to four students. Distribute field notebook pages. Help students select roles:
   - Note taker: records observations
   - Observer(s): relays information to note taker
   - Illustrator/photographer: sketches or photographs key characteristics of the aquatic habitat.
   - Data analyst: creates simple table or graph using data collected.

8. Have the groups visit a nearby aquatic site, taking the field observation worksheet with them. Each student completes his or her task within the group, recording and/or illustrating characteristics of the aquatic habitat. Encourage students to record as much detailed data as they can. For example, if applicable, estimate the number of aquatic plants, or the number of different aquatic organisms. Numerical data can be used later to create a simple table or graph.

9. Return to the classroom and have groups complete their field data worksheets. Remind them to use the examples of common fish and their habitat to make a prediction about what fish species might favor that particular habitat. Write the prediction on the field notebook page.

10. Have the groups share their field notebooks and observations with the class. Did any groups see fish or other living organisms? Remind students that the presence of some organisms can be used as water quality indicators.
11. If no aquatic organisms were seen, what do students predict might live there based on the physical characteristics of the site? Emphasize how much we can learn about a particular habitat by making careful observations.

12. Finally, discuss any factors that may be impacting or altering the habitat, such as proximity to roads or buildings (which might increase runoff), and what steps could be taken to lessen or mitigate these impacts. Examples might include creation of grassy buffer zones to filter urban runoff, shoreline restoration projects that replace concrete banks with natural materials and native plants (soft engineering), or working with local watershed groups to post informational signs to prevent the spread of aquatic invasive species.

**Extension**

- Invite a local fisheries scientist or watershed expert to speak to the class about what is known about the particular habitat visited by the students. For larger rivers and water bodies, scientific assessments can often be found online that document major fish species and historic range. Compare the results with the student predictions. See: MDNR Fish Atlas.
- For older students: Use three-dimensional modeling software to create a virtual habitat that includes environmental threats. Discuss possible mitigations.

Observe the fish habitat at this site. Write a short summary of the habitat based on field observations. Make a prediction about which species of freshwater fish might live in this type of habitat, and why. Include how the habitat illustration and summary above.

Habitat Prediction:

- Habitat traits for example:
  - approximately 6 feet deep
  - clear water
  - rocky bottom

- How do you think the fish might live in this type of habitat?
- What other factors might influence the fish's habitat?

Based on the habitat illustration and summary above, make a prediction about which species of freshwater fish might live in this type of habitat and why. Refer to habitat cards for examples.

Aquatic Habitat Data Worksheet
Lake Whitefish

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Northern Pike

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Coolwater Fish

Eminem: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Yellow Perch

Habitat: Cool, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Black Bullhead

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Warmwater Fish

Largemouth Bass

Habitat: Warm, weedy or brushy lakes and ponds. Prefers weedy areas with lily pads and other aquatic vegetation.

Common Carp

Habitat: Warm, weedy or brushy lakes and ponds. Prefers weedy areas with lily pads and other aquatic vegetation.

Blugill

Habitat: Warm, weedy or brushy lakes and ponds. Prefers weedy areas with lily pads and other aquatic vegetation.

American Muskie

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Lake Trout

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Brook Trout

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Deepwater Sculpin

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Pearlside

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Sprague, Gobies, Black Bullhead

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Lake Whitefish

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Northern Pike

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Yellow Perch

Habitat: Cool, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Black Bullhead

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Warmwater Fish

Largemouth Bass

Habitat: Warm, weedy or brushy lakes and ponds. Prefers weedy areas with lily pads and other aquatic vegetation.

Common Carp

Habitat: Warm, weedy or brushy lakes and ponds. Prefers weedy areas with lily pads and other aquatic vegetation.

Blugill

Habitat: Warm, weedy or brushy lakes and ponds. Prefers weedy areas with lily pads and other aquatic vegetation.

American Muskie

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Lake Trout

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Brook Trout

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Deepwater Sculpin

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Pearlside

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Sprague, Gobies, Black Bullhead

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Lake Whitefish

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.

Northern Pike

Habitat: Cold, clear lakes and streams. Prefers weedy areas with lily pads and other aquatic vegetation.
